Panel weight and thermal transmittance were calculated based on:

- Core density 40 kg/m³
- Core thermal conductivity 0,023 W/m.K
- Steel sheet thicknesses 0.40/0.35 mm
- Coating SP

(Standard EN 8990:1996-09)

They are fixed to the supporting structure using the standard visible fixing method.

Designed for roofs with a minimum slope of 10%.

Fixings are recommended at the crowns rather than in the valleys.

However, if required by project specifications, the overlap length must be from 350 mm to 450 mm and must match the profile pitch.

Max load in span - Load bearing capacity (kg/m²)

Calculations were carried out in accordance with EN 14509; the values indicate the maximum allowable load or the serviceability limit state (l/200), and do not include a safety factor. The facings are steel, with external / internal sheet thicknesses. The support width is 100mm. The anchoring system must be capable of withstanding the maximum allowable loads. The values indicated in the table are indicative.
